For homeland security, nuclear waste should remain in dry cask storage on site. It has been stored there safely for up to 44 years.

The nuclear waste fund would provide 90 million dollars, per site (106) to harden them by constructing repository buildings and berms similar to the method used to store weapons in an ammunition dump.

Even if all nuclear waste were taken off site the nuclear reactors (106) would still be targets.

After the terrorist attacks of 9/11/2001 transportation of nuclear waste would be an unacceptable risk in presenting 6 terrorist targets a day for decades.
