Comments: First off, I am neutral toward the Yucca Mtn project. I believe  
that the US sound be using and developing neuclear energy. Fossil  
fuel waste is more hazardous than neucler waste ever could be. My  
main concern about the site is the geologic instability in the  
Goldfield area. Rarly a day goes by when a small magnitute quake  
isn't recorded in that area. Just a couple of months ago, a  
moderate quake hit that area (<http://www.seismo.unr.edu/Catalog/fing.html>).

How is it that this area can be called safe for a repository that  
has to remain intact for 100,000 years? It seems to me that  
the secision to place the site at Yucca Mtn was based more on  
on politics than on science. As an engineer, I find that to  
be more than a bit unnerving.
