JAN 20 2000

To The U. S. Department of Energy

This is in regards to your proposed radioactive waste shipments from around the nation to Yucca Mountain.

1 [Nothing has changed since you brought the 3 Mile Island waste through here a few years ago. I asked for slower speeds, a different route around cities and better track among other things and still the train ran into some guy crossing the tracks in his car over on Macklind Avenue in the heart of the City of St. Louis. That was from just one reactor and now you want to run all these extremely deadly unstable fuel rod assemblies through major populated areas to a place that is not ready to receive the stuff. Don't tell me you are just going to park it outside some place until the storage place is complete.

These nuclear plants have all been made with temporary storage on site.

The train tracks must be layed on a bed of reinforced concrete and bolted to the roadbed.

Don't even think about driving it down the highway the way people drive in this state. Leave it where it is until all these things are in place. Hey, we've got plenty of time. Let's do it right this time or don't transport it.
