JOHN SCHARFF

- 1 MR. SCHARFF: [My name is John Scharff. I'm affiliated with the Shundahai Network. I'm coming here to testify to some concerns I have of the DEIS concerning future generations and representation here. I don't think it's -- there's accountability if I go to a doctor and he makes a mistake on an operation, then he's accountable, but in this situation, we have a monster that's created that might not rear its ugly head for generations. Therefore, what should we do? The families of these engineers that have created this beast, should we make them accountable? Their future generations?]
- 2 [All I'm saying is that this is one problem that we don't need to leave for our grandchildren, and that the history of the transportation waste has always been one of a leaking legacy. Everywhere that the trucks have gone, there is new contaminated areas. There's more gloves and different handling materials, and by moving it, we're just creating more of this waste that somehow we're going to have to deal with for tens of thousands if not hundreds of thousands of years.]
- 3 [I think that we all can look back at the past at the economics, the history of the nuclear industry and we realize now that the cost of a nuclear power plant might have seemed significant then, but it is nothing compared to the waste that we're dealing with now. We've created an industry that basically we're giving a blank check to, and I think that we need to sit back and leave the waste where it's at and wait another fifty years and maybe somehow we'll have learned to stop making the waste and a way that we can trans -- change it to some way that will not affect new areas of the world.]

Thank you.
